Dungeon Delve

For my Greenfoot project I plan to make a game called Dungeon Delve. The actors I will use are a fantasy adventurer to represent the player, a few giant spiders as the enemies, coins, buttons, a door, and walls. Some events that I want to include are the player and enemy actors moving around a single room, some buttons/levers scattered around the room that the player can interact with, and a door that will open to allow the player to escape if they find all of the buttons/levers and move to the space the door was. I plan to have the game keep score by increasing it when the player interacts with the coins around the room. The goal of the game is to open the room's exit and make it there without being defeated by the monsters. I will further explain each of these aspects of my game in the later paragraphs, starting with the actors.

The first actor I want to talk about will be the one representing the player. As previously said I want to use a fantasy adventurer. The player will be able to move around the room, if they move on the same space as a coin they will collect it and increase their score, and if they move on the same space as a button it will activate the button, which will progress the door to open the exit after all the buttons have been activated.

Moving on from the player actor I want to talk a little about the enemy actors which as mentioned earlier will be giant spider monsters. Like the player actor, the monsters will be able to move around the room, but in random directions, and will trigger the losing scenario if they move into the same space as the player. They might be able to block the way the player wants to go so they will make a good obstacle.

Besides the player and enemy actors there will be a few others that will populate the world, that being the buttons, coins, door, and walls. As previously stated the coins can be interacted with by the player to increase their score, and the buttons will be interacted with to remove the door. The walls however will provide collisions that will confine the actors that can move around inside of the world boundaries. Similar to the walls the door will also have collision and prevent any moving actors from moving into it, but it will disappear after all of the buttons in the world have been interacted with.

In addition to the actors and the way they can interact with each other, I am going to add some sounds to the game that will play. I plan to have a sound for when a player collects a coin, activates a button, or triggers a win or lose scenario. Besides sounds that play based on player interaction, I also plan to incorporate a looping sound that plays while the game is running, and when the door is removed after all of the buttons have been activated.

To conclude I will briefly talk about the end scenarios. For the player to win they must activate all of the buttons to open the exit door and make it to the space the door was previously, where the game will display the winning scenario screen and the game will stop. However if the player occupies the same space as a monster the losing scenario will occur with a game over screen appearing and the game stopping as well.
